### European Technical Assessment ETA-13/0026 of 24/04/2017

I General Part

Technical Assessment Body issuing the ETA and designated according to Article 29 of the Regulation (EU) No 305/2011: ETA-Danmark A/S

Trade name of the construction product:	BB Stanz- und Umformtechnik GmbH post bases
Product family to which the above construction product belongs:	Three-dimensional nailing plate (Post bases)
Manufacturer:	BB Stanz- und Umformtechnik Nordhäuser Str. 44 D-06536 Berga Tel. +49 34651 2988 0 Fax +49 34651 2988 20 Internet <u>www.bb-berga.de</u>
Manufacturing plant:	BB Stanz- und Umformtechnik
This European Technical Assessment contains:	59 pages including 2 annexes which form an integral part of the document
This European Technical Assessment is issued in accordance with Regulation (EU) No 305/2011, on the basis of:	Guideline for European Technical Approval (ETAG) No. 015 Three Dimensional Nailing Plates, April 2013, used as European Assessment Document (EAD).
This version replaces:	The ETA issued on 2013-02-01 and expiry on 2018- 02-01

Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and should be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full (excepted the confidential Annex(es) referred to above). However, partial reproduction may be made, with the written consent of the issuing Technical Assessment Body. Any partial reproduction has to be identified as such.

### II SPECIFIC PART OF THE EUROPEAN TECHNICAL ASSESSMENT

## 1 Technical description of product and intended use

#### Technical description of the product

The BB Stanz- und Umformtechnik post bases are made from 2.5 mm to 8.0 mm thick steel plates in combination with steel tubes and rods. The post bases are produced of steel grade S235JR according to EN 10025-2:2005-04 with a minimum characteristic yield strength of  $R_{eH} = 235 \text{ N/mm}^2$  and a minimum characteristic tensile strength of  $R_m = 360 \text{ N/mm}^2$  and steel grade DD11 according to EN 10111-2:2008 with a minimum characteristic yield strength of  $R_{eL} = 170$ N/mm<sup>2</sup>. The steel tubes are produced of steel grade S195T according to DIN EN 10255:2007 with a minimum characteristic yield strength of  $R_{eH} = 195$ N/mm<sup>2</sup> and a minimum characteristic tensile strength of  $R_m = 320$  N/mm<sup>2</sup>. The steel rods are produced of steel grade S235JRC+C according to EN 10277-2:2008-06 with a minimum characteristic yield strength of  $R_{p0,2} = 260 \text{ N/mm}^2$  and a minimum characteristic tensile strength of  $R_m = 390 \text{ N/mm}^2$ . The threaded rods correspond to property class 4.8 according to DIN EN ISO 898-1:2009-08.

For the connections with metal fasteners dowels  $\emptyset 10 \text{ mm}$  (S235) or bolts  $\emptyset 10 \text{ mm}$  (4.6) and screws  $\emptyset 12x120 \text{ mm}$ ,  $\emptyset 10x100 \text{ mm}$ ,  $\vartheta 10x80 \text{ mm}$ ;  $\vartheta 10x50 \text{ mm}$  or  $\vartheta 6x80 \text{ mm}$  according to EN 14592 (DIN 571 and thread according to DIN 7998) with a minimum characteristic tensile strength of  $R_m = 360 \text{ N/mm}^2$  or according to an ETA are used. The screws shall be driven into predrilled holes according to EN 1995-1-1, 10.4.5 or respectively according to the ETA of the screws.

Dimensions are shown in Annex A and B.

### 2 Specification of the intended use in accordance with the applicable EAD

The intended use of the post bases is the support of timber columns and posts as load-bearing elements, where requirements for mechanical resistance and stability and safety in use in the sense of the Basic Works Requirements 1 and 4 of Regulation (EU) 305/2011 shall be fulfilled.

The static and kinematical behaviour of the timber members or the supports shall be as described in Annex B.

The timber posts may be of solid timber of strength class C24 or better according to EN 338:2016 or of glued laminated timber according to EN 14080:2013.

Minimum dimensions for the post have to be considered (Annex A).

The post base shall be installed as pictured in the drawings. The cross-section of the timber column shall be positioned centrically and with the end grain plane on the base plate. The end grain of the timber post must in general be plane on the base plate of the post base. Post bases types H have a distance between the end grain of the timber post and the base plate of the post base up to 10 mm due to constructive wood preservation.

The maximum distance between the foundation and the base plate of the post base is given in Annex A, table A.1.

Annex B states the load-carrying capacities of the post bases for solid timber of strength class C24 according to EN 338:2016. The design of the connections shall be in accordance with Eurocode 3 and Eurocode 5 or a similar national code. The anchorage of the post base in the foundation and imperfections exceeding the assumptions in Eurocode 5, 5.4.4 are not part of this ETA.

The post bases are for use in timber structures subject to the service classes 1, 2 and 3 of Eurocode 5 and for connections subject to static or quasi-static loading. In service class 1 and 2 the corrosion protection is given by hot-dip zinc coating Z275 according to EN 10147 or zinc coating according to EN1461 with a minimum thickness of 8  $\mu$ m. In service class 3 the corrosion protection is given by hot-dip zinc coating Z350 according to EN 10147 or zinc coating according to EN1461 with a minimum thickness of 55  $\mu$ m.

The metal fasteners must also have a zinc coating according to EN ISO 2081 corresponding to the relevant service class 1, 2 or 3 of EN 1995-1-1. Galvanic zinc coating of the post bases is only suitable for service classes 1 and 2.

The scope of the hangers regarding resistance to corrosion shall be defined according to national provisions that apply at the installation site considering environmental conditions.

The provisions made in this European Technical Assessment are based on an assumed intended working life of the post bases of 50 years.

The indications given on the working life cannot be interpreted as a guarantee given by the producer or Assessment Body, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

Char	acteristic	Assessment of characteristic		
3.1	Mechanical resistance and stability*) (BWR1)			
Chara	cteristic load-carrying capacity	See Annex B		
Stiffn	ess	No performance determined		
Ducti	lity in cyclic testing	No performance determined		
3.2	Safety in case of fire (BWR2)			
React	ion to fire	The post bases are made from steel classified as <b>Euroclass A1</b> in accordance with EN 13501-1 and Commission Delegated Regulation 2016/364		
3.3	Hygiene, health and the environment (BWR3)			
Influe	ence on air quality	The product does not contain/release dangerou substances specified in TR 034, dated March 2012 0**)		
3.7	Sustainable use of natural resources (BWR7)	No Performance Determined		
3.8 the	General aspects related to the performance of product	The post bases have been assessed as having satisfactory durability and serviceability when used in timber structures using the timber species described in Eurocode 5 and subject to the conditions defined by service class 1, 2 and 3		
Identi	fication	See Annex A		
*) See a	additional information in section 3.9 – 3.11.			

### **3** Performance of the product and references to the methods used for its assessment

\*\*) In addition to the specific clauses relating to dangerous substances contained in this European technical Assessment, there may be other requirements applicable to the products falling within its scope (e.g. transposed European legislation and national laws, regulations and administrative provisions). In order to meet the provisions of the Construction Products Regulation, these requirements need also to be complied with, when and where they apply.

### 3.9 Mechanical resistance and stability

### Safety principles and partial factors

The characteristic load-carrying capacities are based on the characteristic values of the connections with metal fasteners, the steel components and the timber post.

In the case of timber failure or failure of the metal fasteners, the design values shall be calculated according to EN 1995-1-1 by dividing the characteristic values of the load-carrying capacities by different partial factors for the strength properties, and in addition multiplied with the coefficient  $k_{mod}$ .

In the case of steel failure, the design value shall be calculated according to EN 1993-1-1 by reducing the characteristic values of the load-carrying capacity with different partial factors.

The design value of the load-carrying capacity is the smaller value of all load-carrying capacities:

$$F_{Rd} = \min\left\{\frac{k_{mod} \cdot F_{Rk,T}}{\gamma_{M,T}}; \frac{F_{Rk,S}}{\gamma_{Mi,S}}\right\}$$

Therefore, for timber failure or failure of the metal fasteners the load duration class and the service class are included. The different partial factors  $\gamma_M$  for steel or timber failure, respectively, are also correctly taken into account

#### Mechanical resistance and stability

See Annex B for the characteristic load-carrying capacity in the different directions  $F_1$  to  $F_5$  for solid timber of strength class C24 according to EN 338:2016. Using the load-carrying capacities of the post bases, the specifications in Annex A must be fulfilled.

The characteristic capacities of the post bases are determined by a combination of calculation according to Eurocode 3 and Eurocode 5 and testing. They should be used for designs in accordance with Eurocode 3 and Eurocode 5 or a similar national code.

No performance has been determined in relation to ductility of a joint under cyclic testing. The contribution to the performance of structures in seismic zones, therefore, has not been assessed.

No performance has been determined in relation to the joint's stiffness properties - to be used for the analysis of the serviceability limit state.

No performance has been determined in relation to the anchorage of the post bases in the foundation. It must be checked by the designer of the structure to ensure it is not less than the post base capacity and, if necessary, the post base capacity reduced accordingly. Therefore the specifications for the lever arms  $e_{F2/F3}$  (for load case  $F_2 / F_3$ ) and  $e_{F4/F5}$  (for load case  $F_4 / F_5$ ) in annex A have to be considered. The lever arm is the distance between the top edge of the foundation and the load.

### 3.10 Aspects related to the performance of the product

2.7.1 Corrosion protection in service class 1 and 2.

In accordance with ETAG 015 the post bases are produced from steel grade S235JR according to EN 10025-2:2005-04 with a minimum characteristic yield strength of  $R_{eH} = 235 \text{ N/mm}^2$  and a minimum characteristic tensile strength of  $R_m = 360 \text{ N/mm}^2$  and steel grade DD11 according to EN 10111-2:2008 with a minimum characteristic yield strength of  $R_{eL} = 170$ N/mm<sup>2</sup>. The steel tubes are produced of steel grade S195T according to DIN EN 10255:2007 with a minimum characteristic yield strength of  $R_{eH} = 195$ N/mm<sup>2</sup> and a minimum characteristic tensile strength of  $R_m = 320$  N/mm<sup>2</sup>. The steel rods are produced of steel grade S235JRC+C according to EN 10277-2:2008-06 with a minimum characteristic yield strength of  $R_{p0,2} = 260 \text{ N/mm}^2$  and a minimum characteristic tensile strength of  $R_m = 390 \text{ N/mm}^2$ . The threaded rods correspond to property class 4.8 according to DIN EN ISO 898-1:2009-08

The post bases are for use in timber structures subject to the service classes 1, 2 and 3 of Eurocode 5 and for connections subject to static or quasi-static loading. In service class 1 and 2 the corrosion protection is given by hot-dip zinc coating Z275 according to EN 10147 or zinc coating according to EN1461 with a minimum thickness of 8  $\mu$ m. In service class 3 the corrosion protection is given by hot-dip zinc coating Z350 according to EN 10147 or zinc coating according to EN1461 with a minimum thickness of 55  $\mu$ m.

The metal fasteners must also have a zinc coating according to EN ISO 2081 corresponding to the relevant service class 1, 2 or 3 of EN 1995-1-1.

### **3.11** General aspects related to the fitness for use of the product

The performances given in this ETA are based on the following:

- The timber post
  - shall be restrained against rotation, and supported at the lower and upper end
  - shall be strength class C24 or better according

to EN 338:2016

- shall be free from wane in the post base
- must fulfil the requirements regarding minimum dimensions (see Annex A)
- end grain must in general be plane on the base plate or spacer of the post base or at a maximum distance given in Annex A.
- The post base shall be installed centrically in the cross-section of the timber column.
- The actual end bearing capacity of the timber member to be used in conjunction with the post base is checked by the designer of the structure to ensure it is not less than the post base capacity and, if necessary, the post base capacity reduced accordingly.
- There are no specific requirements relating to preparation of the timber members.
- The minimum insertion depth in the turnbuckles should be the diameter of the rod.
- The base plates of the post bases with steel tubes as support must in general be plane on the tube's end.
- The anchorage of the post base in the foundation is not part of this ETA. It must be checked by the designer of the structure to ensure it is not less than the post base capacity and, if necessary, the post base capacity reduced accordingly. Therefore, the specifications for the lever arms e<sub>F2/F3</sub> (for load case F<sub>2</sub> / F<sub>3</sub>) and e<sub>F4/F5</sub> (for load case F<sub>4</sub> / F<sub>5</sub>) in Annex A have to be considered. The lever arm is the distance between the top edge of the foundation and the load.

### 4 Attestation and verification of constancy of performance (AVCP)

### 4.1 AVCP system

According to the decision 97/638/EC of the European Commission1, as amended, the system(s) of assessment and verification of constancy of performance (see Annex V to Regulation (EU) No 305/2011) is 2+.

# 5 Technical details necessary for the implementation of the AVCP system, as foreseen in the applicable EAD

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited at ETA-Danmark prior to CE marking.

Issued in Copenhagen on 2017-04-24 by

Thomas Bruun Managing Director, ETA-Danmark

Continuation of Table B.1 Characteristic load-carrying capacities for post bases in kN

 $\gamma_{M(T)}$ : partial factor for solid timber according to EN 1995-1-1 and national annex  $\gamma_{M(C)}$ : partial factor for connections according to EN 1995-1-1 and national annex  $\gamma_{M,0;}\gamma_{M,1;}\gamma_{M,2}$ : partial factors according to EN 1993-1-1 and national annex

### Definitions of forces, their directions and eccentricity

• Force F<sub>1</sub>: tensile or compression load

- Force  $F_2 / F_3$ : horizontal parallel to the ground plate of the post base and perpendicular to the bolts or dowels

- Force  $F_4$  /  $F_5$ : horizontal load parallel to the ground plate of the post base and parallel to the bolts or dowels

### **Acting forces**

F<sub>1</sub> axial force (tension or compression) acting along the central axis of the joint

- $F_2$  and  $F_3$  horizontal force perpendicular to the ground plate of the post base acting with the lever arm  $e_{F2/F3}$  above the foundation
- $F_4$  and  $F_5$  horizontal force parallel to the ground plate of the post base acting with the lever arm  $e_{F4/F5}$  above the foundation

### **Combined forces**

If the forces  $F_1$  and  $F_2/F_3$  or  $F_4/F_5$  act at the same time, the following inequality shall be fulfilled:

$$\sum \frac{F_{i,Ed}}{F_{i,Rd}} \leq 1$$

The forces  $F_2$  and  $F_3$  or  $F_4$  and  $F_5$  are forces with opposite direction. Therefore only one force  $F_2$  or  $F_3$ , and  $F_4$  or  $F_5$ , respectively, is able to act simultaneously with  $F_1$ .
